

In regard to this BPL Proposal:

Allowing Broadband Power Line high speed communications at this time would have devastating effects on High Frequency Radio Communications. While Satellite communications has replaced much High Frequency communications, there still are a lot of users dependant on High Frequency radio. The interference level has been proven to disrupt weak signal communications.

While BPL as a concept is good, current technology will not prevent it from disrupting radio communications. I'm sure that as fast as technology is advancing, the Power Companies with all their assets, can find an alternative method that will not be in the High Frequency Radio spectrum. Their ability to demonstrate a new communications medium does not give them license to push it down the worlds throat! I ask you to rule against this and make these powerful, well financed corporations come up with something better.

Thank you for your consideration.
